F&O lists

Futures price change computed from one Angel One FULL quote snapshot (ltp vs previous close). Price gainers, price losers and OI gainers are not in this edition (page 12). OI change % = OI change ÷ (OI − OI change), from Angel One's OI-buildup feed. Long buildup = price up, OI up; short buildup = price down, OI up; short covering = price up, OI down; long unwinding = price down, OI down. Every label is checked against the signs before publishing.

Checks run before publishing

Validator rules A1–A10: timestamps, full-chain PCR recomputation and chain completeness, buildup signs, one price per contract, indicator convergence, public source links with status, attribution wording, dated headings, calendar status, index closes vs feed. An independent verification then recomputes indicators, pivots, PCR, closes and futures changes from the raw files with separate code. Raw files: `00_INBOX/mar ket_data/raw/2026-11-05_081525` (sha256 manifest).

Settlement price vs live quote

A crude futures settlement is the official end-of-session price set by the exchange. A live quote is the latest trade, and it keeps moving overnight. Brent's front-month contract can also differ from the next month's, so two correct figures can look different.

Example: Brent settled at $94.62 on Wednesday (S11). DSIJ showed $94.30 at 07:02 IST (S7), and Business Standard quoted January futures at $93 with no time given (S5).

Before comparing two crude prices, check the contract month and the time. A percentage change means little until you know which base it uses.
